

Answers/Solutions

1. $32 * 24 = 768$.
2. $12 * 11 = 132$.
3. $26 * 100 = 2600$
4. $2^8 = 256$
5. Three ways:
 - a. only bad thing is beginning AND ending with 0, so $2^8 - 2^6 = 192$.
 - b. Start with 1 or end with 1 but not both: $2^7 + 2^7 - 2^6 = 192$
 - c. Three ways to start/end (0-1, 1-0, or 1-1), and 2^6 ways to fill in the middle six bits: $3 \cdot 2^6 = 192$.
6. $10^3 \cdot 26^3 = 17576000$
7. $n!$
8. $2 \cdot 1 \cdot 3 \cdot 2 \cdot 1 \cdot 2 \cdot 1 \cdot 1 = 24$. ($8! = 40320$, so that's a pretty big speed up.)
9. See book.
10. $36^6 - 26^6 + 36^7 - 26^7 + 36^8 - 26^8 = 2684483063360$
11. $26 * (36^5 - 26^5) + 26 * (36^6 - 26^6) + 26 * (36^7 - 26^7) = 1878468937280$
12.
 - a. $30 * 29 * 28 = 24360$
 - b. $1 * 29 * 28 + 29 * 1 * 28 + 29 * 28 * 1 = 30 * 29 * 28 - 29 * 28 * 27 = 2436$
